Using the Test program to verify your solution
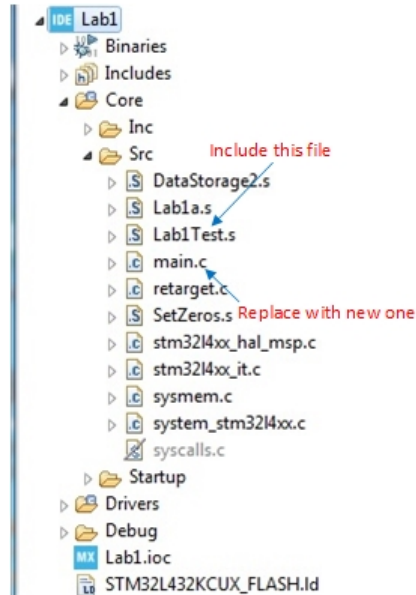

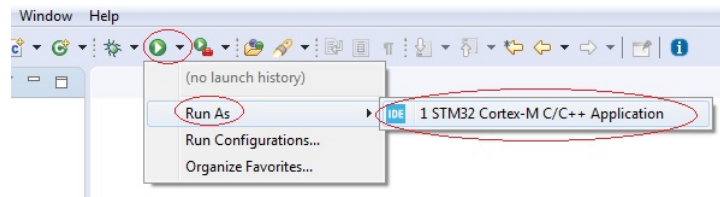

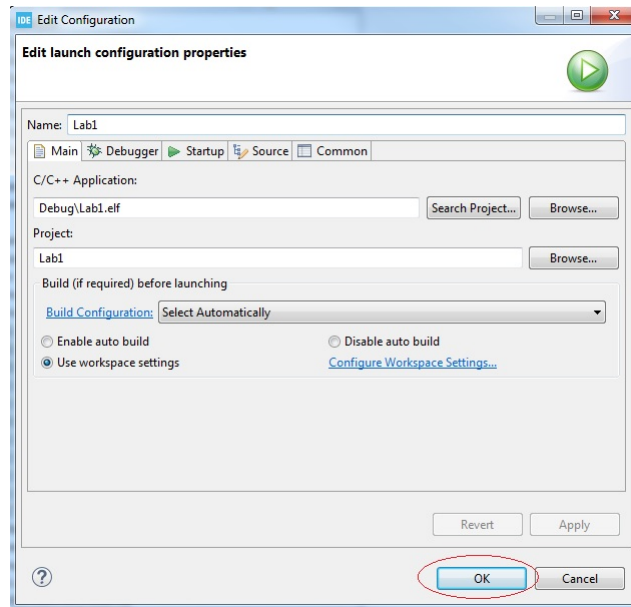

1. Download the files from the 'lab1TestProgram' folder on Eclass and move them into your project folder. Make sure you replace the old 'main.c' with the new one.

2. If you don't see your files, refresh your project to confirm they are there

3. Launch the program 'MTTTY' and connect it to the board

4. Compile the project and download it to the Nucleo board. Instead of a debug session, we can simply run it instead. Click on the 'Run' button and launch a run configuration.

5. Using the Menu in 'MTTTY', select which program you would like to test. In the example below, you can only test one solution at a time. Enter 1 to test part A. Verify your solution. Replace part A solution with part B. Repeat the above steps .
